

LXI is a standard for Ethernet instruments. It provides a web page for the instrument. There are two ways to access the web page for each device. All of the GTS;s ethernet devices web pages are listed as "Favorites in Internet Explorer.

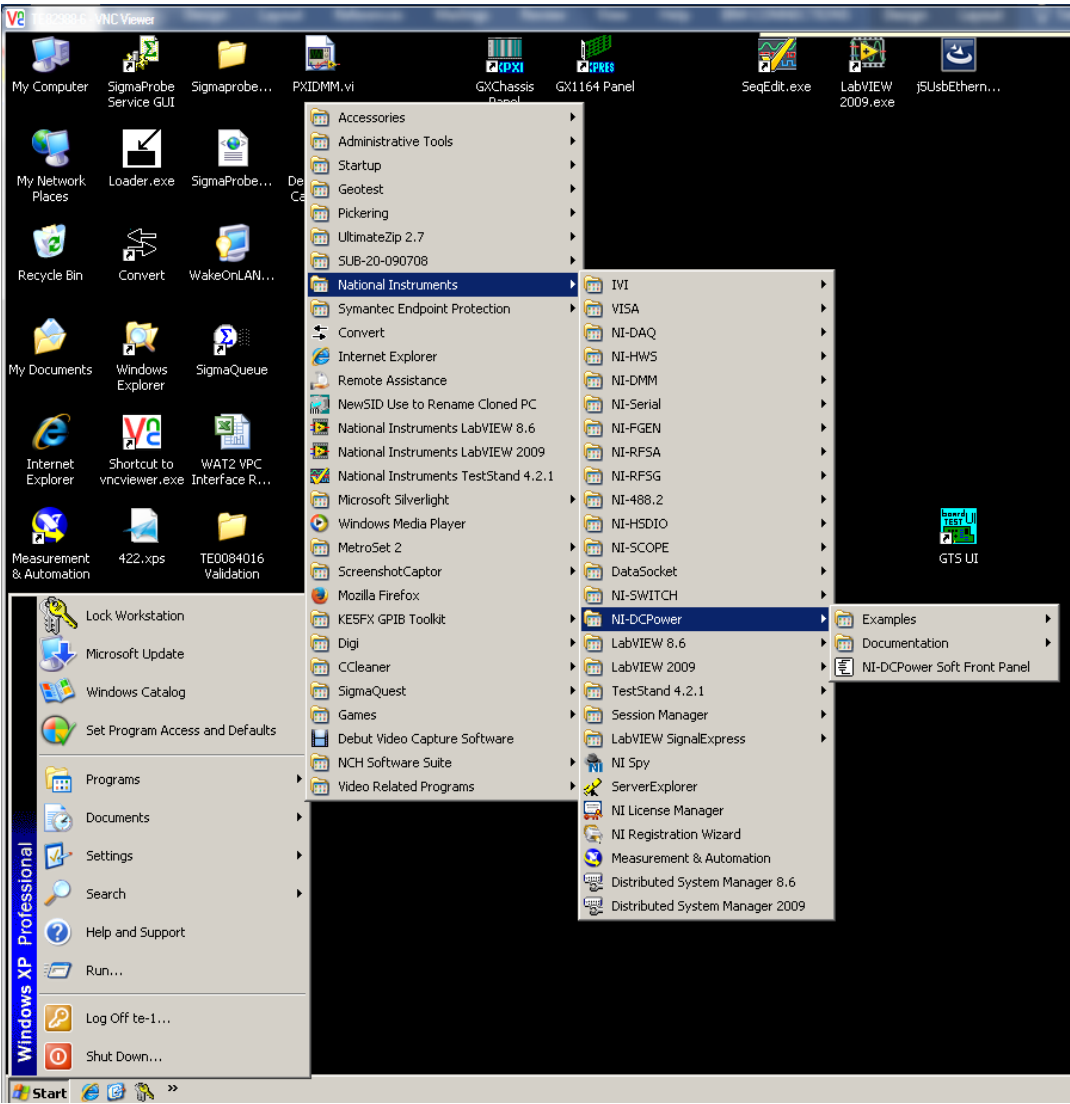

Or you can use the web page from National Instruments Measurement and Automation Explorer (MAX)

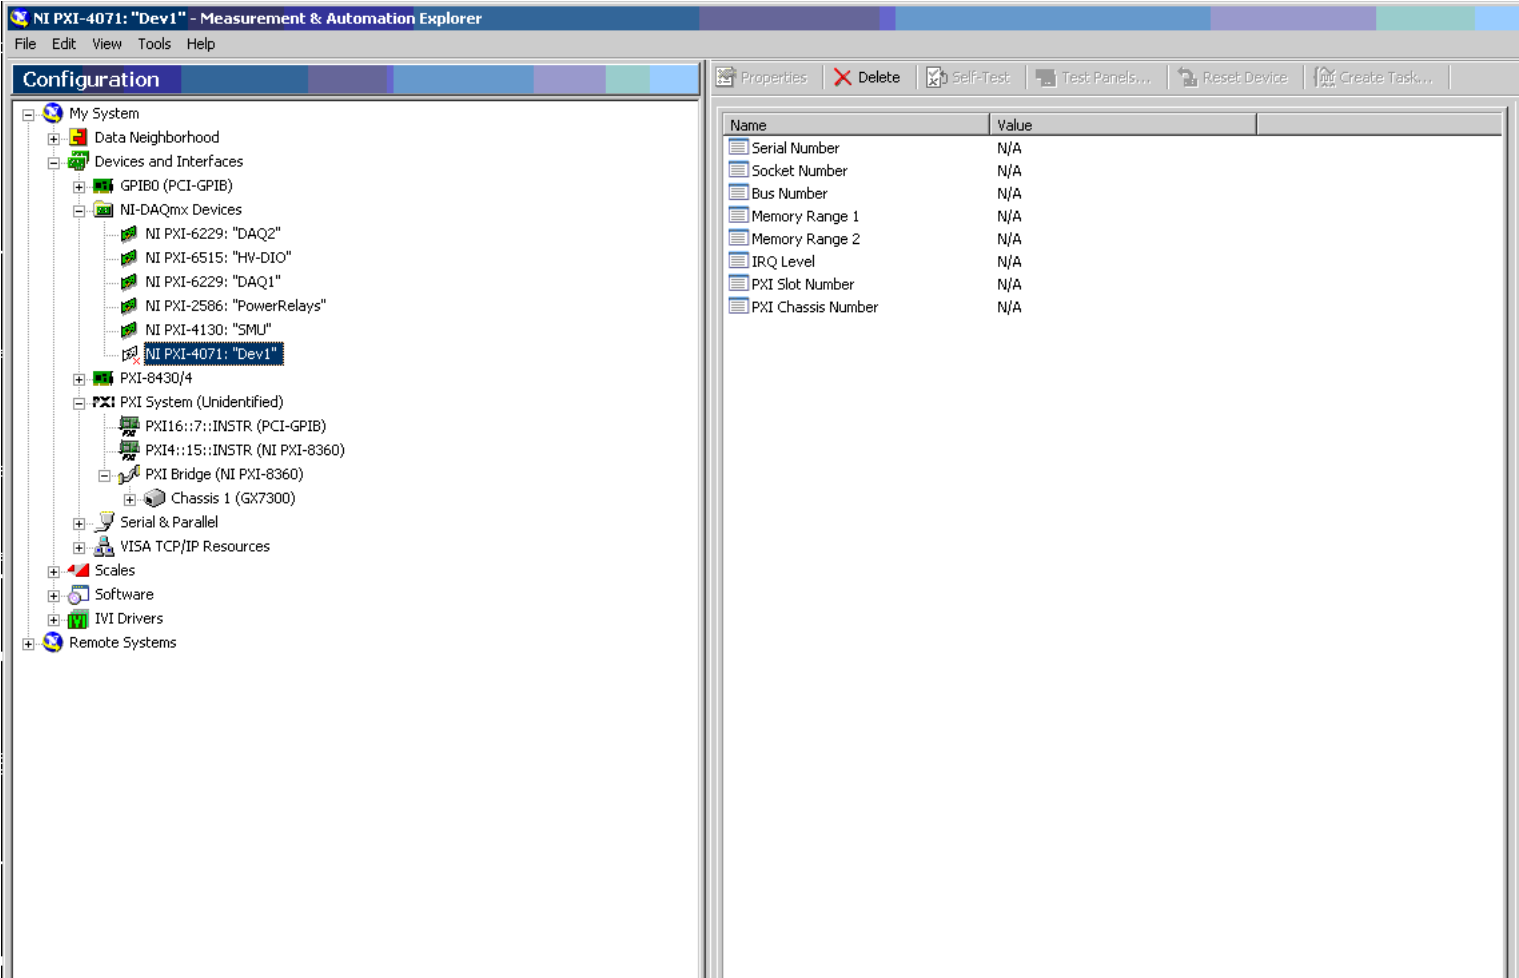

See at the bottom, the tab that says Web Page

NI DCPower Soft Front Panel is found from the Start Menu.

The NI Calibration Executive must be purchased and licensed by the calibration lab. Yes they must use their own PC with the software installed, to calibrate the DAQ cards as described in the procedure.

I don't know why the DMM was not recognized. Did you re-start the PC after installing?
This tells me that the DMM was installed and is now removed. Install the DMM, restart the PC. Then I can try to get it up and running.

Once the DMM is installed, recognized, and initialized all the Lambda power supplies and the GX1164 can be calibrated in a matter of minutes.
